

Positioning and use of the No Pull Training Harness

Xtremepetproducts.com

Prepare harness by making one large loop and one smaller loop as show in photo 1.

Hold the loops with the smaller loop closest to your body as shown in photo 2.

Slip both loops over the dogs head at the same time with the large loop going on first. See photo 3.

Lift the dogs front legs forward through the larger loop one at a time. Then position the larger loop around the dogs mid-section as shown in photo 4.

How it works:

The elastic adjustment loop should be set approximately 2" back from the metal ring when the harness is slightly tight around the dogs mid-section (see photo 5). Without tension on the leash the mid-section of the harness should be slightly loose. As the dog pulls, the harness around the mid-section will tighten. After a short period of time the dog will learn not to pull.
